**LUNG CANCER IS THE #1 CANCER KILLER IN MALES AND #3 IN FEMALES IN SINGAPORE**.

More than 60% of lung cancer diagnosed between 2015 to 2019 are at Stage IV.

Lung cancer typically has no symptoms until the advanced stages. The more advanced the lung cancer, the lower the 5-year survival rate.

**WHAT IS LUNG CANCER SCREENING?**

Doctors use a low-dose computed tomography (LDCT) scan of the lungs to look for abnormalities in at-risk individuals who do not have symptoms.

**WHY IT’S DONE?**

The goal is to detect lung cancer at a very early stage — when it’s more likely to be cured. At present, annual lung cancer screening is recommended for smokers.

**WHAT OVERSEAS RESEARCH SAYS ABOUT LUNG CANCER SCREENING:**

Lung cancer is diagnosed at earlier stages with screening.

**THE BEST TIME TO SCREEN IS WHEN YOU STILL FEEL FINE.**

DID YOU KNOW?

- More non-smokers are getting lung cancer in the last 10 years.
- Majority of females with lung cancer have not smoked before.
- There aren’t any early lung cancer warning signs.

“An ounce of prevention is worth a pound of cure.”

-Benjamin Franklin

The 1st local lung cancer screening study, SingapOre Lung cancer Screening Through Integrating CT with other biomarkErs (SOLSTICE) will begin enrolment in Jan 2023. More information is available on the SOLSTICE recruitment poster/pamphlet!
